Activity: APIs - updating sub-documents

In the lesson we saw how to update MongoDB documents using Mongoose instance methods. The challenge in this activity is to write the controller to update a sub-document - a review.

Tips

1. Sub-documents are accessed through their parent document
2. Sub-documents cannot be saved by themselves, only the parent
3. Try combining parts of the code from finding a specific review, updating a hotel and creating a new review

The source code

If you want the code before any of the "update" routing and controllers were written, you can get the zip from the previous lesson. If you get stuck, the zip attached to this lesson contains the completed code.
